

isPositive

This demonstrates a very basic custom validator, which returns correct if the submitted answer is positive.

JavaScript

```
1 // NOTE: The below are intended to be used inside an \answer optional argument with the validator key, NOT in
2
3 var x
4 // Check to see if input is positive.
5 function isPositive(number) {
6     return number > 0;
7 };
8
```

Problem 1 This shows a basic “isPositive” validator, that simply checks to see if the input is positive.

Notice that the validator completely overrides the expected answer, as the correctness of the answer is determined by the validator returning true/false, and this validator doesn’t actually use the provided answer in any way.

Enter a number!
